Detection of outages of servers and computers with installed C-Monitor client

Detection of outages (server down) runs on the basis of an ongoing online communication between the CM Server and C-Monitor client. The C-Monitor client contacts the CM Server every 15 to 30 seconds (the interval depends on license and the current setting of the CM server) and if this connection isn´t accomplished, interval for notification of outage is being counted.

Minimal outage times for notification according to the type of C-Monitor client license:

Premium (Server/Workstation) **1 min**
Standard (Workstation) **1 min**
BASIC (Server/Workstation) **15min**

This applies for all supported operating systems: MS Windows, Linux/FreeBSD, (Mac) OS X.
