

Typical properties of the component CM NTFS Permissions

- provides a unique graphic view for setting of NTFS accesses in the Windows operating systems for all users at once
- export of the graphic overview into XLS files
- enables to effectively display authorization for the selected user or a group in a structure of directories
- archives the settings of NTFS accesses for later manual setting (automatic restore of accesses is not implemented)
- enables to compare a setting of permissions towards previous settings and then display changes (separately, it is only possible to display added settings, removed settings, changed settings)
- easy gathering of permissions, activation of the gathering through a Wizard in scheduled tasks.
