Installation of CM Server in case of rental runs just by registration of maintainer access and subsequent adjustment of the environment under the logged Maintainer - after the first login through a maintainer account, you'll be automatically prompted to create a maintainer company, the procedure of its creation is described in the section Activation of maintainer company [1]. Then you shall adjust the CM Server environment under the logged maintainer, description of these settings is further specified in the section Maintainer [2].

Installation of CM server is performed only **in case of custom CM server.**

CM server is operated under operating system Linux.

The installation is performed by the producer of the Customer Monitor system - contact on producer **[3], the installation runs remotely, by allowing access to server.**

To operate the server, you don't need Linux specialists; maintenance, backup and update are performed by the SW producer, within the maintenance fee. Also other services may be ordered, e.g. restore of CM server function after a HW failure.

HW a SW requirements for server operation are described in the section
požiadavky na prevádzku servera sú bližšie popísané v časti HW and SW requirements **[4].**
